2 Summary of Learning

Throughout these research papers, I learned more information specifically about malware and how malware is executed. These citations provide necessary information regarding malware analysis, which is similar to my project topic. One of the main tools that I am going to be utilized is Virustotal.com as well as Any.run. These tools have been utilized in the research papers above as it is secure for malware analysis.

3 Proposed Project Approach

The way I’m going to approach this project is split up into different phases: Collection, Analysis, and Conclusion. The collection phase is going to be collecting malware files and get the virtualized environment prepared for analysis. The environment that will be used is Any.run, which is a website that can create a

virtual machine and can log file processes that will be crucial for analysis. The next phase is the actual analysis portion of the project. Specifically, I will be analyzing file processes, potential HTTP packets, API calls, and how the malware functions. The final phase is the conclusion portion of the project. This will be in regards to documenting my finds from the analysis phase. I will also conclude any trends or patterns in the malware for common vulnerabilities. Additionally, I will suggest technologies to prevent those specific malware attacks and to suggest future works for malware analysis research.

4 Next-Phase Plan

In my next report, my next few objectives are to execute my proposed approach and the overall evaluation of the project. After execution of the approach, I plan to document all my findings in my GitHub repository.
